MAYDAY

YOUR ACADEMIC LIFE, UNDER CONTROL.

CONCEPT STAGE • WORK IN PROGRESS

PROJECT TYPE EdTech · Productivity	**STARTED** October 2026
PLANNED TOOLS Google AI Studio · Firebase	**CURRENT PHASE** Product discovery & requirements planning

Overview

MAYDAY is a college study companion concept designed to make academic life easier to organise, understand and manage. It brings academic planning, focus sessions, subject management and AI-assisted learning together in one accessible experience.

The core idea is simple: a study app should make student life easier, not give students another thing to manage.

MAYDAY is being designed to work from the moment it opens, even before students enter their academic information. As they add subjects, exams and deadlines, the experience can gradually become more personalised without forcing them through lengthy setup processes.

The Problem

College students often juggle multiple subjects, exams, assignments, deadlines and study schedules across different tools. Keeping everything organised can become another source of stress, while rigid study plans may stop being useful when priorities change.

MAYDAY aims to bring these activities together in a simple, flexible and student-friendly environment.

Planned Features

- Academic Dashboard — A central home screen for daily priorities, upcoming exams, deadlines and progress.
- Study Planner — Organise subjects, units, topics, exams and assignments, with plans intended to adapt as students make progress.
- Focus Timer — Start a focus session immediately, without requiring semester setup.
- AI Study Companion — Get explanations, ask questions and practise concepts, with support for relevant study materials planned.
- Personalisation — Dark-first design, solid-colour themes, custom backgrounds and built-in profile avatars.

- Offline-First Experience — Keep core functionality and locally stored information available wherever practical, with optional cloud synchronisation planned.
- Accessible Interface — Responsive layouts, reduced-motion preferences, adjustable text size and readability protections.

Design Philosophy

- Simple by default: The interface should be understandable without tutorials.
- Useful immediately: Core tools should remain accessible without mandatory registration or academic setup.
- Personalised gradually: The experience improves as students provide information, without repeatedly demanding input.
- Reliable and transparent: Saving, syncing, connectivity and data management should be clear to the user.

The intended visual personality is playful and modern, with a dark-first interface that feels approachable without sacrificing readability.

Technical Direction

The project is currently being planned for development using Google AI Studio, with Firebase selected as the intended backend direction for authentication and cloud data services.

The planned architecture prioritises local data storage, guest access, optional account-based synchronisation and careful handling of data conflicts. Implementation details and integration work remain outstanding.

Current Progress

MAYDAY is in the concept and product-requirements stage. Its initial app structure, onboarding approach, navigation, appearance settings, accessibility requirements, offline behaviour and backend direction have been discussed and defined.

The next steps are to finalise the foundation specification, resolve remaining architectural dependencies and begin implementation in stages.

Project Vision

MAYDAY aims to become a dependable academic companion that helps students spend less energy organising their workload and more energy actually learning.

PROJECT STATUS
Currently in product planning. Features described above are planned and have not yet been represented as implemented or verified.
